

Hello, the following are the processes that we currently have working on our current website. Although we are changing the look of teamcabinets.com, there are details we need to discuss.

All these items must remain in the new environment. We are aware that you the” Developer” will implement a method to exchange this code to the syntax that best fits for Laravel. We know there are tools that you can use to maintain all the work we have created to date. We also know that this will take time, and we are willing to give you this large task at hand. We have these items listed below, they will all need to be set to a generic function, but still maintaining the same function, only the names will be changed. Example: Cabinet to Product. Catalog to Product Catalog

Back End:

- [Dashboard](#)
- [User Management](#)
- [User Orders](#)
- [Users Shipping Quotes](#)
- [Order Tracker](#)
- [Users Quotes](#)
- [Stock Check Requests](#)
- [Manage User Role](#)
- [Manage Home Page](#)
- [Manage Documents](#)
- [Manage SMTP Details](#)
- [Manage Emails Content](#)
- [User Claims](#)
- [User Uploads](#)
- [Commissions Report](#)

- [Cabinets](#)
- [Cabinet Section](#)
- [Catalog](#)
- [Terms & Conditions](#)
- [Contact Us Queries](#)
- [Contact Us Settings](#)
- [Bulletin](#)
- [Credit/Debit/ACH Charges](#)
- [Sales Tax Management](#)
- [Tax/Commission/Shipping Totals](#)
- [Fuel Charges Settings](#)
- [About Us Settings](#)
- [Manage Success/Error Content](#)
- [Paytrace Password Settings](#)

Dashboard: This is used to implement if a product is in stock, or in inventory and a method to say the following:

Dashboard

Notes Title	
Stock check	2
Stock check	
All in stock	2
Missing items	2
Trans#	
QBPO#	2
Conf Client Pay	
Q#	2
PaySL	2
Pay Artstar	
SO#	2
Assemble	
PU Date	2
BOL	2
Deliver	
Pending	2
Complete	
Cancel	2
All in stock	2

This list shows what stage the product is currently in and is used daily.

1. Front End- A User logs in to the website.
2. Goes to "Create an Order"
3. Fill in details by searching for the product or pulling down a list of the items, double click into the cart.
4. Once cart is ready, and the order has been double checked by using the Yellow and Green Box on the left side of the cart. The User now goes to the bottom of the page and can select to do a "Stock Check, Print, Save As a Quote, share to another person, which should have a sign offline approving the order and a method to sign and return to User.
5. Once Stock Check is clicked on, the Stock Check goes to the Backend Admin Portal. This needs to be a little reconstructed, because currently we are thinking about one User and There is no Global Admin Assigned by the Pinnacle. We will get into more of this soon.
6. The function now is My Stock Check in Admin has a RED signal showing there is a Stock Check, and if you are in another section of the website, you will see it in Stock Check Request.
7. Now, sometimes we have all the inventory in Stock, but when we do not, we use other Vendors to fill the Order. Sometime these orders have 2 or 3 up to 10 Vendors. The site does not currently have this functionality, but we will get there. But this is good to review.
8. Once the Back End receives this information, we make the best decision, and you will see that the website automatically adds the stock check number in the Dashboard. When we approve this Stock Check, the User should have an indicator, notifying the User that their Stock Check has been Approved. Then, in Stock Check Tab, you will see that the Users Information now has the "SC#" and whether it has been approved or now.
9. Backend clicks on the Pull-down menu letting Admin know that All is in Stock, Missing, Trans or being delivered to us by a Vendor, and follow down the list, that we will make sure all parties know what stage the order is in.
10. Once approved, the end User goes to Stock Check, clicks View and this pulls up the Shopping Cart and at the bottom is show Approved go to Payments. We can review this, but it works for us now. So, please do not change this functionality.
11. Once the items is paid for, see the Notice at User Orders, as now this item is paid and there is an automatic prompt that goes to the DASHBORAD showing what Order was Paid, What the Order Number is, How much was Paid, Date of payment, whether or not we will assemble the Product, and when do we expect to deliver or have client Pick Up Order.
12. Now in Orders we have a Customer Name, Their Status (Representative, Dealer, or Affiliate) Order, Order Number, Cost, Weight of Order for shipping purposes, Total Dollar charged. Paid or Not or Canceled from pull down. This feature is auto paid or pending automatically from system. Very Important. Then we can View Order, Print Pick List for warehouse, email to warehouse, and resend to QuickBooks and finally or delete the entire Order. It happens. However, this Order that is now deleted, needs to be kept in it's own Database in case of confusion or misunderstanding. Only the User can delete the Order, not an affiliate. "Global Admin", may assist in all of these functions.
13. The Order Tracker is a Duplicate of the Dashboard, it was the primary function until we added the full Tracker to the Dashboard. Both are useful, but we prefer the Dashboard with the Tracker.

User Management:

Our User Management is the CRM, but it is not fully developed, we plan to add more features to this. For now, it is fully functional and holds User Information on the Back End. On the front end once approved. The User Signs in and can see a full menu. This information is critical and assigns permissions. See Affiliates. We will address this in a meeting.

User Shipping Quotes:

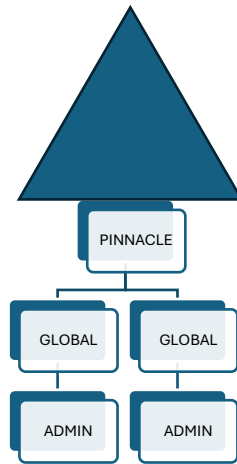

This needs more development; we intend to add an API for our system on the Backend that allows us to shop for the best shipping rates. We will address this later. Stores all the Stock Check information and allows for a User to Store this information until ready to purchase. This needs to have taxes added this to create a full estimate with email, print and save functions.

User Quotes and User Shipping Quotes: are the result of several upgrades to this system. We will remove this Button and make **User Quotes** with all the functionality and field to save information for the End User.

We will review the next sections in another breakdown once we have this part of the system completed.

Pinnacle:

1. Pinnacle serves as an overall permission database that controls all functionality from the top down.
2. Pinnacle allows Global level permissions for each item that Global levels offer.
3. Think Subscriptions and Billing. Then assignment for each module in a hierarchy method of permissions.
4. Basic Function is to control who runs Global levels.
5. Global levels have multiple Admins. Basic on/off for Admins. Basic on/off for module subscriptions.

Pinnacle is the host of all activities.

6. Let us call Pinnacle “P” to save time.
7. “P” allows each global leader to maintain accounts under it’s hierarchy.
8. “P” gives “GA” authority to open databases by selecting each module granted by switching on/off.
9. “P” holds all passwords, databases, and order subscription control for each “GA” account.
10. As an ERP we will have multi-level approvals for the following:
11. Pinnacle offers each of these modules to Global to manage.
12. Global can then assign each module to the User, who can then offer to their affiliates, and affiliates, affiliates.
13. This already exists in the current website.

ERP Broken into modules:

1. ERP comes with the following standard modules:
 - CRM is a subscription that allows the User to maintain a database of up to one hundred contacts.
 - CRM includes Name, Address, Phone, Email, Reminders, and Notes up to one hundred characters.
 - CRM may print database information by exporting the text into Excel as a .csv file.

Pinnacle has a new client; this is a separate CRM exclusively for Pinnacle.

- Pinnacle turns on the subscription.
- Pinnacle assigns the subscription to Global Admin

- Global Admin assigns the subscription to User.
- User has access to build a database and assign a separate database to the User, Affiliate, and End User.
- “P” may have up to 100 “GA” positions as set framework.

2. Chain of Command is in motion.

- User contacts Global and request the following applications: Finance API
- Global replies with, “what application do you use for accounting?”
- User replies: “QuickBooks”
- At this point we will be reselling QuickBooks for the end user, as Pinnacle is now a reseller of QB.
- We sell the subscription which includes a setup feature to start the User with the CRM, and QB API.
- Users will pay the subscription fee, plus the integration of setting up their data to work flawlessly.
- Now, Global holds the responsibility of maintaining the subscription for Pinnacle.
- This shall be the start of integration with APIs for the following:
 - a. Accounting Software
 - b. Analytic and Reporting software
 - c. Human Resource software
 - d. Project Management software
 - e. Inventory Management software.
 - f. GPS and RFID tracking software
 - g. Live Camera feeds inside of our portal
 - h. Sales and Commissions, which includes graph reports, standard statistics for time spent on this transaction.

And a host to more opportunities. This will allow us to contract more developers for integration and allow the system to run multiple projects for each User’s needs.

Pinnacle set the pricing for Global. Global sets the pricing and hourly rates for User. User sets the pricing for Affiliates.

Now we have a system that is fully functional to work with about any function we want to introduce.

All module assignments come from pinnacles with a subscription billing capability, which includes the following:

Invoicing to the User directly. Global has control to turn on and off the billing cycle, but all payment comes directly to Pinnacle by way of an email system, with reminders at 60 days, 30 days, 15 days, 10 days, 5 days, 72 hours, 24 and 12. Until paid. This gives Global time to collect and consult with User.

Global never collects currency, it simply allows features and integration to take place and offers permission granted.

From Pinnacle.

Pinnacle will have a Company name that will perform the Subscription cycle, and we will use an API for this type of system or create one specific to our needs.

Global:

The “GA” function is an operator, it does not deal with collecting, it simply answers technical questions, implementation, and permissions. Global also serves as a help desk for Users.

This includes the following:

- a. All Global Administrators have primary responsibility for each of their Databases.
- b. All Global Administrators are neutral, and serv in the capacity of maintaining the hierarchy database.

- c. Global Administrators cannot compete with another Global Administrator, as permission is granted by Pinnacle.
- d. "GA", assist in Onboarding Users
- e. How to use our software
- f. How to accomplish goals using our integrated software assignments
- g. "GA" will assign functionality for User.
- h. How to build infrastructure with Sales and Commissions.
- i. How to build affiliates and use the hierarchy systems to show results, graphs, forecasting and more...
- j. Review and test Users experiences for each step to be developed.
- k. Brings Pinnacle the plan of solutions to the forefront and manages the implementation of specific needs by User.
- l. "GA" has the function to have zoom or Any desk features that can be recorded and stored videos of all meetings.
- m. Each "GA" will have the function to log in time associated with Users to manage service for up to one hundred users.
- n. "GA" to have the ability to post to Users platform for education and surveys for each User in a Private room.
- o. "GA" to have the ability to turn on Bulletin settings for Messages to go out to all Users Dashboards.
- p. "GA" manages the User pathways for growth, by creating customized functionality for Users with Developers.
- q. All levels have selective print ability, but NOT necessarily downloadable ability, as this software will have permission-based functionality, based on the level of subscription and monitored by "GA."
- r. "P" shall see what "GA" has performed, which includes what User and Affiliates have used in this system. In time we will be able to monitor how Users work, and if they are using functions assigned to them. Help User keep an eye out for employees and work details, which will improve over time.
- s. Cookies, Cloudflare, systems to be activated to assure safety for all Users.
- t. "GA" and direct Dev will manage Security system permissions and Security to make or implement security.
- u. Additional security may be offered on a subscription-based APIs to assure maximum security.
- v. Chat-GPT will be offered, but we will need to be able to secure ourselves from these types of tools. So, we may grant access to this directly to our systems and monitor keywords to assure the User is not attempting to re-work permissions by implementing keywords that will call for security in our systems, including attempts to enter backend of our software by using other software's, we will discuss this in detail.
- w. Credit Card use, plan to offer a secure system that accept credit cards use as a subscription-based product. This includes multi-level passwords assigned by "P" and given to "GA", which will activate the User "U".
- x. All subscriptions sold, my come by way of an additional User called "Internal Sales" of "*IS". Global assigns sales teams to sell additional subscriptions to our systems. This group will receive a detailed CRM to go after Users and its affiliates with the permissions from Users. Users shall have a set menu for the following:
 - a. I have a client that is a User, and they want to know if they can add a feature.
 - b. Global will have the option to add features, or assign the feature to *IS, and give a commission base to *IS and be able to follow their workflow by details, graphs, and analytics. The system will outgrow the "GA". So, we need to frame a way to allow assignments from "GA." "GA" sets up the request for the Subscription and "P" is already notified to move forward or to stop the Subscription.
 - c. The ability to add more to each User will change, so by building the framework to expect these changes, our team will be able to develop more API functionality and Assignments for groups such as *IS.

Subscriptions:

When subscriptions are implemented or requested, there should be a procedure, see the following:

- a. All basic information. Name, Address, Billing and Shipping fields.
- b. The actual request from User. What do you want to do?
- c. Testing before implementation, review with client, education, and hourly rate for conducting this service.
- d. Global takes assignments, sends to Development, Development offers the cost to turn on feature, "GA" presents this to "P", and "P" implements an agreement to the User or End User.
- e. After agreements in place, "P" assigns this API to User and the invoicing to End User will be updated to new subscription policy.
- f. "GA" now sees the new implementation and can monitor the activity.
- g. "GA" reviews testing, all Fields and communicates with Development for any changes needed. (Help Desk)

- h. All subscriptions will have detailed language describing all liabilities for the use of any software, this policy must be designed to be signed by User or End User, to assure that we are only a reseller of this service and only maintain billing for all legal reasons.
- i. “P” and “GA” shall receive all technical alerts throughout entire systems and from all other Global Accounts.
- j. This system should have a debug report that is live and calls out all information that is not working properly.
- k. After “P” is briefed on suspicious activity from “GA”, “GA” shall have the authority to remedy any or all databases from other “GA”’s when needed, as “GA” shall have the ability to Login to another “GA” to review or audit when needed. “P” has the authority to enter all databases and have a detailed report across the board for all development, including tests and implementation. All “GA”’s are on the same level for growth purposes, and all “GA”’s will have access to each other databases granted from Pinnacle.

Users:

Users are the company that has subscribed to our service. Our service has a monthly and Annual subscription.

The Users signs an agreement though “DocuSign”, or equivalent and Global takes the initiative to Onboard the new client, review what their subscription entails and set the timelines for User to begin.

1. User now has CRM.
2. CRM can upgrade to server space.
3. CRM can implement other services by requesting a check box that our developers will design.

See the following:

These functions will be renamed, but the idea of implementing these functions needs to appear in a chart.

CRM	USER ☐	AFFILIATE ☐	2 AFFILIATES ☐	3 AFFILIATES ☐
QUICKBOOKS	USER ☐	AFFILIATE ☐	2 AFFILIATES ☐	3 AFFILIATES ☐
INVENTORY	USER ☐	AFFILIATE ☐	2 AFFILIATES ☐	3 AFFILIATES ☐

This will be created by Developers for the “GA” and “Users” for all subscriptions.

DASHBOARD:

The dashboard is a Global feature that no User can shut off. We call this a bulletin, and it is placed on the Users Dashboard. This is where we show upgrades available to our service. Videos, SEO articles, Blog type messages and a way that we communicate with Users and find ideas that appeal to their interest. “Do you know” type articles, finding out if the User could use another function. Posting may be by print, others by video that teach the User about our systems.

When a User logs in, the first thing they will see is the side bar menu to the left, their Logo on the top right-hand side of the page, then the Bulleting right in the center below the header bar of the site and approximately 900 x 750 pixels.

To the right of the Bulleting, a list of videos on how to operate our system. Div size approximately 500 x 350 that will open to a full page if clicked on. This is designed to save phone calls and email about simple functions. This also serves as a help guide that the User does not have to ask for. We need the User to be engaged. The Global Administrator will develop these help videos as we incur different experiences with all Users.

Basic video on the following:

1. How to enter your logo for your Database CRM.
2. How to use the CRM
3. How to Share a contact ****” But not the Database CRM” (this requires permissions and based on subscriptions)
4. How to create your own Catalog for your products.
5. How to implement your CRM to have more functionality, by clicking here, you can ask you “GA” to sign up for this.
6. How to manage your local tax jar. Update your system with your state and city tax requirements. Usually in QB.
7. How to run reports from each of your affiliates.
8. How to implement “inventory”

This will help the “GA” with time management and allow the “GA” to act on a per case scenario. This will now create s “Ticket” for the “GA” to manage in a database that will show the following:

1. Who is making this request? User Only
2. Who is this request for, User or Affiliate 1,2,3, or all?
3. Start Date, Subscription modification, now sent to “P” for assignment to “GA” and always in this order.

Break Here: We will introduce the next level of functionality when we reach this point.

Please review the entire website and ask questions when you are ready.

Thank you,

Tom Rodriguez
